Techmania Science Center

The Pilsner Techmania Science Center is one of the most unique projects of its kind in the Czech Republic.

The goal of Techmania is to help the public, especially young people, to get more familiar with science, technology and with the development of human knowledge in general. Another aim is to point out the unanswered questions for which the next generation, the young visitors of the science center, would find answers.

Techmania is based on explanations of particular physical or mathematical principles by means of game-like activities. The interactivity involves visitors making the exhibits move, so the natural principle will be demonstrated by the particular process. In these cases, learning is based on personal experience.
